

OTC Offers the Complete TPMS Solution

The OTC® Tire Pressure Monitor Kit provides technicians with a complete solution for servicing TPMS vehicles. The kit includes a TPM interface tool and a complete information and reset procedure manual. While requiring little or no knowledge of TPMS, the kit utilizes a make-year-model vehicle reference. From there, all the necessary instruction is provided, dramatically reducing or eliminating training time.

How it works...

The OTC TPM tool features a graphical display that quickly and efficiently guides the user through the TPM service. The software allows for the selection of a specific vehicle being serviced, and provides proper vehicle interface every time. This not only eliminates the need for memorizing frequencies and/or scrolling through extensive lists of possibilities, but it also saves tremendous time in "searching" for proper communication to each sensor. The OTC TPM tool is universally compatible with most TPMS vehicles and graphically displays each step of the reset process as well as references critical system information provided in the manuals. It is also updateable and displays transmitted sensor information for direct systems.

Understanding TPMS

It is important to understand the fundamentals of servicing TPMS vehicles, and the detailed 3-volume manual included in the OTC Tire Pressure Monitor Kit provides very complete information for servicing both direct and in-direct systems. "Information is equally as important as the tool in order to successfully service vehicles with TPMS," stated Robert Kochie, Product Manager of OTC Electronics. "We felt it was critical to include as much information on these systems as possible, from reset procedures to tire mounting procedures and valve stem torque specs." All this information is targeted where it is needed most – in the technicians hands. The OTC TPM Tool and manual are designed to be used together, each providing key functionality in completing the service procedure.

The OTC TPM Kit comes complete with the TPM tool, a magnet, procedure manual, and a carry case. The TPM Tool activates RF sensors and can display sensor data such as ID, pressure, temperature, and sensor mode (dependent upon the type of TPMS). The magnet is used on magnetically activated sensors. The manual is available in a 3 volume set, on CD format, or as a reset quick reference guide.
